Pushup Detector

Description:
Create an AI model (Pushup Detector), which will analyse the actions of athlete based on which
a) If athlete is performing push up infornt of device camera, it will display as "PUSHUP".
b) If athlete is performing any other skill, let's say pull ups infront of device camera, it will display as "NOT A PUSH UP"

Good to have but not mandatory:
Capability to get the model trained with any other skill as well , like if it is trained with the pull up skill it can become a Pullup Detector.

Note:
Please attach a read.me file addressing the steps to follow to run your AI model.

Good Luck!
